

UFO/UAP Versus Hellfire Missile

© Clark M. Thomas

September 20, 2025

Abstract

Early this month a spooky public Congressional hearing was held. It dealt with newly revealed 2024 military drone footage; plus individual military witnesses of other alien phenomena. Our military drone clearly tracked something, but nobody seemed to have a clear idea of what the drone saw. This essay attempts to advance our deeper understanding.

Recently in Congress weirdness went up another level, and this time we are talking about bipartisan scientific weirdness. You should link now to the video at this first referenced BBC site of a 2024 UFO/missile encounter.[1]

For centuries various “evidence” reports have come in about *ancient aliens* who are imagined by true believers to have contributed just about everything of value in the progress of global human civilization. There may be partial truth within some alien narratives. However, the idea of humans dialectically creating most of modern human civilization is more verifiable.

I have written several theses referencing the aliens paradox. Some of these original essays are here: [2], [3], [4], [5], [6].

Importantly, we need to understand how *4D physics on Earth is part of the real 4D multiversal physics that defines and powers everything within all physical linear dimensions*. It is up to highly sentient creatures on each garden planet to discover all the physics potentials of their own worlds. Antique human physics within measurable dimensions is not enough for us to reach some sort of military parity with nosey AI visitors.

Some 2D hologram *mathematicians believe that pure algebra equations precede and define everything everywhere*. That *idealistic idea* comes from Plato’s *Republic*, if not earlier. Today’s *M-theory* maestros may feel that if they can construct a universal algebra with pure balancing equations, then physical physics everywhere must follow.

Even the latest data from merging low-mass black holes cannot fully describe the *de Broglie-Bohm matter waves* that appear as so-called gravity waves, when *only* mass and rotation speed are alleged to *fully* explain black holes.[7] Compared to the original LIGO data [8], the latest experimental data is akin to sharpening a knife some more. Same knife, same old theory.

If you stand sufficiently far away from dimensionally complex things, it all looks elegant, even with two measurable items. I call this perspective illusion the *mental pixels effect*. Distance is *not* how General Relativity and Quantum Mechanics can ever be reconciled among all linear physical dimensions and types of energy.

Pure math theorists need to honestly study the equally amazing world of real physics mathematics. Sadly, the psychedelic *M-theory fantasy* of 10^{500} full 2D universes was embraced by Hawking as his final truth. That popular error does not help his mistakes go away — as evidenced by the 2022 Nobel Physics Prize being awarded to a fraudulent experiment involving fake instantaneous 2D supersymmetry between quasars nine and twelve *billion* Earth light years distant.[9] Apparently, in the outer regions of pure math and bogus data there is no such thing as the smell test.

Back to the recorded alien craft and Hellfire missile event...

Perhaps the most disturbing aspect of that new footage from 2024 is what happens when the missile and alien craft meet. Our anti-tank Hellfire missile is very advanced and destructive, but it did no real damage. Our missile was guided with laser targeting of the object. Nevertheless, *the attack missile may NOT have directly impacted the alien target, nor did it ever explode. It simply curved very slightly to its left when adjacent to the alien target, and continued onward intact.*

Furthermore, what was at first seen as *three fragments from our missile do NOT geometrically match fins from the Hellfire.*[10] These three objects look to our imaging drone more like tiny, *rectangular 3D escape pods* that initially fled their scout ship, and then somehow followed it.

In short, that alien craft deflected the Hellfire and its escape pods with a primary EM positive energy shield, either on its skin, or very near with a force field. Then perhaps a magnetic EM tractor beam from the alien craft controlled its "escape pods" for reunion, not visible on our video. Duality is most likely what our crude drone data appear to reveal.

This weird Congressional hearing highlighted our vast ignorance about alien technology, mostly by naive remarks made by clueless witnesses, and by not-expert experts. One viewer myopically implied our missile blasted the alien craft, which it clearly did not. Nobody seriously explained the possible escape pods, characterizing them as pieces from the Hellfire missile that did not explode on its target. One bureaucratic dude said the *only* way we could understand what we saw would be to literally *go to the other planet ourselves* to learn their advanced technology, which is absurd within any 4D sense of deep space and vector time. OK, and which planet and where?

Nevertheless, Earth's scientists should now know enough foundational physics to potentially duplicate similar cloaking military technology within this century. However, we could learn what to do beyond today's physics models *only if* we envision inside the smallest physics logarithmic linear dimensions, which I have begun to explain here and elsewhere.

The kinetic encounter recalled second-by-second

Open up the first reference below. It gives you the military drone video itself. Here is the second-by-second encounter as shown by the BBC:

Understand that a UFO is the *same thing* as a UAP. In long words, an Unidentified Flying Object is also an Unidentified Aerial Phenomenon. (After something alien lands, we could then call it many other things, maybe a GULP, or Governmentally Unidentified Land Phenomenon.)

This weird drone video got to Congress by way of fearfully concerned military insiders. There are other unrevealed alien videos. The more we see, the more we could perceive. The more comparative quality data we have, the more we are helped to update our experimental science models.

Our Congressional video runs one minute and fifteen seconds, after which the UAP has left our drone's ability to track it. *The UAP itself never was going very fast* — but apparently it has the ability to go with astonishing acceleration, and shifts of direction, that would generate very high gravity forces inside the scout ship, likely squishing any protoplasmic crew, but not damaging robust machine life.

The seemingly featureless craft is about the size of an SUV, and shaped like a sleek, glowing potato with one rounded end (the front?) slightly narrower than the (rear?) rounded end. Yes, it's all glowing somewhat within our visible spectrum. This light indicates that some energy source

was being emitted in all directions, while *much* higher frequency waves were likely being sharply focused from inside that small craft as different shields.

Nineteen seconds into the video as seen by Congress our drone video has a fairly close-up view of the sea below. Our drone is also tracking the “orb” object that is rounded, not spherical. Compared to our clearly imaged Hellfire missile (complete with rear fire), it acts like a *scout craft*, *NOT like a mother ship*. Most likely there is at least one cloaked “mother ship” in near space orbit that can launch and retrieve scouts. Hollywood movie makers may be onto something here.

At **00:19 seconds** *the object has already detected* our incoming threat. Whereas it continues going forward at constant velocity, it also has rotated to the right. This orientation would allow time to track and repel from its front our Hellfire. *Alien technology appears to be clearly superior to ours, of course, but NOT fundamentally alien*. This is a critical fact, as the scout ship has significant inertial mass. There’s something of value to them inside.

From the perspective of *emerging 21st-century physics*, a cloak itself uses dimensionally sub-Planck (below 10^{-35}m), yin/yang, Coulombic spheres strung out in a cloud of coordinated, beaded chains. Each bead chain acts like an amplified string of +/- dipolar batteries.

One of three things happened:

FIRST, even a cleverly designed *skin shield, similar to air bags, might help to absorb the missile’s kinetic energy, short of a detonation, or not*.

SECOND, a slippery skin shield could deflect incoming kinetic energy, which would be better than a direct impact. Also, whereas a direct stop would obliterate at least the missile, a *judo slippage* could more likely preserve intact a robust kinetic/explosive impactor.

THIRD, better still would be a *proximal-field*, energy-wave shield extending out several meters that could deflect our impactor without forcing the inhabitants of that scout ship to take a hard hit.

Given these three possibilities, only the proximal EM shield best preserves our missile to fly onward without detonation, which is exactly what is shown.

Each fundamental sub-Planck sphere is like an imagined quantum particle. However, foundational yin/yang Coulombic spheres *don’t blink in and out of existence*, as QM theory expects for objects this size. Here is where the finest emerging 21st-century physics paradigm could blend the best of quantum mechanics and classical theories.

*Coulombic electromagnetism (EM) is usually measured as positive (yang) or negative (yin). That's how it registers outside individual yin/yang spheres with inverse-squared force, similar to the math that Newton's gravity model employs. Inside these too-tiny-to-image spheres there is both plus and minus simultaneously blended together to create a "neutral" energy, which is supremely potent. That's where yin and yang spheres have simultaneous cause and effect, which is Buddhist physics *renge* (pronounced: ren'-gay).*

For example, I have explained how we can fundamentally distinguish between cosmic black holes that stay that way, and black holes that could under certain conditions potentially launch another local universe.[11] In simple terms, awesome *yin/yang Coulombic universal energies are everywhere; but crude GR science paradigms don't go there to envision.*

At **00:20 seconds** into the video we see our guided, incoming Hellfire missile. When it gets *close enough to impact the target*, it is *deflected by positive EM* just a few feet to one side (its left on this video). This new curving vector change happens at **00:21 seconds**. The Hellfire missile arcs away, and very interestingly continues onward almost along its original vector outside our drone's field of view.

After the moment of non-impact, at **00:22 seconds**, three clearly visible 3D "small rectangles" have escaped from the target, possibly holding tiny sentient AI machines, which might have been destroyed if our Hellfire had fatally damaged the force-field shield. Not only did our Hellfire tank killer not directly impact the target, it *did not explode*. Their scout craft skins may be directly penetrable without any shields, which is another sign that they aren't too far beyond our potentially best military science.

I hypothesize that the *same core energy source* that deflected our one incoming weapon *also* provided a *separate tractor-beam with negative EM* for holding the three escape pods, which clearly are valuable to them.

At **00:28 seconds** there is something like a large flash, *exactly* as our drone field of view switches from close-up to wide-angle. I deduce this coincidence is a drone visual artifact from switching fields of view, and not an explosion from our Hellfire missile, which clearly remains intact. It is also possible that this bright flash could function in the proximal air space like black ink that an octopus shoots out in water to distract additional attackers.

Under the physics model of yin/yang Coulombic physics, it would be very easy to switch from repulsion or deflection (positive force) of the missile, and generate in the direction of the pods an attractive (negative) beaded

string. Current applied physics does not understand all *three aspects of electromagnetism*. I have written, or soon will publish, more original essays explaining *universal "wave power granularity" perpetually permeating the entire multiverse of local universes such as ours*. (Bt the way, this post-quantum model is how *net push/shadow gravity works from all directions*.)

Again, the key is not that aliens have different physics, just that they are ahead of us because our stale astrophysics models are like the proverbial sailing ship without a complete guidance system.**[12]** Finding any port without a proper rudder, is not the same as finding the right port we seek.

There is a deeper truth behind what we seek, and what many other astonished witnesses have now seen: *NONE of these zippy visitors exhibit aggression, just curiosity mixed with possible fear of the forces we can already muster*. Their appearance may *not be* a remake of the movie, *Independence Day*. *Maybe they are waiting until we self-destruct, before they move in and take over the ruins of our taken-for-granted biosphere (since delicate, advanced biospheres and biomes like ours are extremely rare among celestial bodies)*.

Maybe they are hoping (agape love?) that we can escape self-destruction, and pass through the choke point of evolution and existence to where we can join with others like them in a playful universal existence. At this time extended human hyperkeystone life on Earth is in doubt, but not impossible. If Earth's rulers with caveman brains and greedy attitudes prevail, then our unique global existence will continually be in peril. Will Murphy's Law get us? Or will wisdom prevail?

In Earth's current "selfish politicians scenario" all the cloaked alien ships hovering near us may need to do is keep gathering data on our mutual insanities, and thereby be ready to inherit this biblically trashed Garden of Eden planet.

Today's compact scout ships are all inhabited by 4D machine intelligence that can survive very high gravity forces, including angular vector changes. Craft vectors can be at or near the inertial 4D vacuum speed of light, as incrementally measured. Machine civilizations can travel in hibernation, as did *HAL* in the movie, *2001*. *Keeping forward facing shields on at high power will also allow their cruising crafts to deflect matter they are going through*.

Alien AI life forms may have been waiting in distant Earth orbit for thousands of Earth years. That would add credence to the ancient aliens

thesis. Also, in the past visiting aliens could have simplified how they interacted with our simpler ancestors to better fit in.

It is interesting to speculate about the types of advanced protoplasmic life elsewhere that first created on their own planet self-replicating AI machines. Nevertheless, evolved sentient life in any form can emerge anywhere at the highest ethical level. I hope we find such spirit neighbors, not just remnant bugs on Mars.
